Subject: Verizon cell tower

Board,

I've been in a wireless training seminar all day (wireless transmission, not specifically cell phones) and have learned about several products that support the "backhaul" of information wirelessly for several miles. This equipment is frequently used for the backhaul of cell phone data from cell towers to the central office, or other location.

So, a question I have for Verizon on their need to relocate due to inability to bring more fiber to the existing tower is "why can't they use wireless backhaul technology instead of fiber?".

Just thought I'd let you know such technologies are in common use today.

Regards,

Bruce Reichlen
